SUMMARY

Full-stack engineer who owns entire products end to end — backend architecture, AI pipelines, and the React frontends on top — at companies where there was no one to hand things off to. Took a healthcare platform from company pivot to its first paying US clinic, and shipped the complete frontend of an AI voice product that grew from zero to \$10K MRR in 11 months. Deep TypeScript across the stack, production LLM integration, and a habit of building systems that recover from failure on their own.

EXPERIENCE

Software Development Engineer

Jan 2025 – Apr 2026

Diagna AI | diagna.ai | Gurugram, India

- Owned FAXFlo end to end from company pivot to **first paying US clinic** — architected the core backend (**40+ REST endpoints**, TypeScript/Express, JWT + RBAC) over a **PostgreSQL/Prisma** schema of ~25 models, and shipped both production **React** frontends on it: the clinical inbox with dual-view AI document editor, eFax, and scheduling, plus an internal data-quality dashboard for merging patient records.
- Engineered the distributed **AWS ingestion pipeline** (S3 · SQS · SNS · Bedrock) for automated medical fax/email processing — **BullMQ/Redis** workers with DB-level idempotency, and a **dead-letter queue reprocessing system** that self-heals transient failures and surfaces the rest for review.
- Evolved AI extraction from **Textract OCR to vision LLMs** after OCR couldn't recover semantic structure from messy medical faxes — multi-model routing on **AWS Bedrock** (**Claude Sonnet** primary, **Amazon Nova Pro** fallback) across 20+ document categories with structured JSON extraction and confidence scoring; the product achieves **94%+ AI accuracy**, saving clinics **20+ hours/week**.
- Solved EHR write-back for the **MDLand EHR** (legacy frame-based system, no usable write API) with a **Python RPA suite** (FastAPI · Robocorp · Playwright) — OTP/2FA login, patient search with middle-name disambiguation, document upload across **47+ nested iframes** — backed by **Redis + RQ** queuing with triple-fallback selectors and S3 artifact capture; integrated **Medplum (FHIR)** for patient/appointment sync.
- Designed a **multi-tenant frontend architecture** with per-clinic feature flags and role-based rendering, so onboarding a clinic needed config changes, not code; built an AI SMS orchestrator across Twilio/Telnyx/Vonage with idempotent opt-in/opt-out, hardening critical paths with **Jest + Supertest** tests.

Frontend Developer

Dec 2023 – Jan 2025

Oriserve | voicegenie.ai | Noida, India

- Built the entire VoiceGenie frontend from scratch in 11 months (**React, Next.js, TypeScript, Redux**) — customer dashboard, AI campaign builder, and post-call analytics with recordings, transcripts, per-segment emotion detection, and AI-extracted entities; the product went from **nothing to \$10K MRR** on this work, closing its first enterprise customers.
- Shipped the full campaign creation flow: a live **@token script composer** resolving per-contact variables at call time (@name, @appointment), an **ElevenLabs** voice configuration panel, and real-time per-contact call status — every call personalized dynamically, no hardcoded scripts.
- Cut page load times **30%** (Lighthouse-profiled) via code splitting, lazy loading, and caching, directly reducing enterprise churn tied to responsiveness; integrated **HubSpot, GoHighLevel, and Cal.com** end to end in TypeScript, owning every integration contract without a dedicated backend counterpart.

PROJECTS

MotionStudio — [Live Demo](#) | [GitHub](#)

Personal product, 2026

- Full-stack video editing product built solo: **React 19/TypeScript** compositor on Remotion with a single-mutation-point Zustand architecture (undo/redo, autosave, cloud sync), backed by a serverless **AWS Lambda** render pipeline behind a 4-gate guard — JWT → device fingerprint → quota → invoke — so failed renders never consume quota; **Supabase/PostgreSQL** auth with row-level security.

SKILLS

Languages: TypeScript, JavaScript (ES6+), Python, SQL, C/C++

Backend: Node.js, Express, FastAPI, REST API Design, PostgreSQL, Prisma, Redis, BullMQ, RQ, JWT/RBAC, Swagger

Cloud & Systems: AWS (S3, SQS, SNS, Bedrock, Lambda), Distributed Queues, DLQ Design, Idempotency, Serverless

AI Integration: AWS Bedrock, Claude, Amazon Nova, Multi-Model Routing, Structured Extraction, RPA (Robocorp, Playwright)

Frontend: React 19, Next.js, Zustand, Redux, Ant Design, Tailwind CSS, Vite

Quality & AI Dev Tools: Jest, Supertest, Vitest, React Testing Library, Code Review, PostHog, Claude Code, Cursor

EDUCATION

B.Tech in Computer Science & Engineering, IET, Dr. Ram Manohar Lohia Awadh University, Ayodhya

2019 – 2023 | 81%
